

This is the first time a CS student might be trying to work on something that is creative apart from Algorithms, Assembly code, Functional Programming or anything that sounds fascinating to ignorant students of other degrees.

So, Hello

I'm Advait and I will be running for the Freshers Rep of CompSoc @ The University of Edinburgh. A little bit about myself, I am currently use Emacs and I hope that the person reading this does too. However, I will keep it short and easy and follow as many programming practices possible. As a CompSoc freshers rep, I hope to be quick in communicating events to the other Freshman students and at the same time *try* to accommodate everyones needs and demand. Moving on to specific changes, I'd like to push for more workshops on how students can gain relevant industry experience for developing their personal projects, which would be essential for hackathons and also their CV. Moreover, I'd be striving for generating interest towards the SIG's under CompSoc by conducting beginner workshops for students with absolutely no knowledge in the field.

In all, I'd like to conclude by saying that being the First Year Rep of Comp Soc would not only help me make Computer Science fun for other students but also develop me as a leader in this University.
